

AGENTIC DOMINANCE • COMPLETE SYSTEM

The Complete System Buyer Guide & Setup Workbook

This guide explains exactly what the \$318 Complete System includes, how the delivery process works, what information you need to provide, and how we move from payment to launch-ready implementation.

Offer: Agentic Dominance Complete System — \$318 one-time

Who it is for: founders, operators, creators, and digital product builders who want the Agentic Dominance model, supporting assets, and a clear handoff process so implementation can begin quickly.

5,000+ page blueprint

10 agent templates

Email sequences

Sales page assets

Funnel blueprints

Action workbook

What you get with the \$318 Complete System

This package is the full strategic and operational blueprint for getting an Agentic Dominance product deployment organized. It is designed to move a buyer from interest to implementation readiness.

- **Main blueprint:** the long-form Agentic Dominance PDF covering system architecture, agent roles, workflow design, handoffs, launch process, and scaling logic.
- **10 agent SKILL.md templates:** editable agent role templates ready to adapt to the buyer's niche, offer, and workflow.
- **Complete email sequence pack:** launch, follow-up, nurture, and conversion-focused messaging assets.
- **ClickBank/JVZoo style sales page template:** conversion-oriented copy and layout structure that can be adapted for the buyer's own product.
- **Funnel architecture blueprints:** visual planning for front-end, upsell, follow-up, and continuity pathways.
- **Ad copy and content calendar:** pre-built promotional assets to shorten launch time.
- **This setup workbook:** a plain-English explanation of the process plus note sections so the buyer can collect what is needed for implementation.

How the workflow works after purchase

1. **You complete payment.** After payment, you land on the thank-you page and can download this guide.
2. **You review what is included.** This document explains the scope, requirements, and expected next actions.
3. **You gather your implementation details.** The notes sections after each chapter are there so you can record the exact inputs needed.
4. **You reply with the requested information.** Once the required items are provided, implementation can begin.
5. **The setup is prepared for your chosen product/domain/model path.** This is where the buyer's information becomes the basis for the actual deployment work.

Important: the \$318 Complete System is the structured blueprint and buyer package that prepares the build. It gets the product owner organized and ready. It does not automatically include the full done-for-you annual service described in the \$786 tier.

What you need to provide so setup can begin

To move from payment into action, the buyer needs to send back a short set of implementation details. These are the exact items required for the current offer structure.

Chapter 1 — API access for the agent stack

You will need at least one AI API the system can use. This can be OpenAI, xAI, Claude, or another provider you choose, as long as it supports the workflow being deployed.

- Preferred providers: OpenAI, xAI, Claude
- You can choose one provider or a combination
- The key purpose is to let the agent system connect to your chosen model endpoint

Notes — record your API provider(s), account email, and anything special about your setup

Chapter 2 — Your chosen domain

You will need the domain you want this model blueprint or offer to run on. This is the front-facing address customers will use.

- Use an existing domain you control, or buy a new one
- If you already have DNS access, setup moves faster
- Subdomains can also work if that fits your structure better

Notes — write the domain, registrar, DNS access details, and any related preferences

Chapter 3 — Hosting account details

To start configuration, we need the buyer's name and email for the hosting account. These details can be updated later, but they are needed to begin.

- Name for the account owner
- Email for the hosting setup
- Preferred hosting environment if already chosen

Notes — record account holder name, email, and any hosting preferences

Chapter 4 — Contact email for the project

The contact email for this workflow is:

contactblocknewsmedia@gmail.com

This should be treated as the project contact address for buyer communication in the current process.

Notes — add any support or notification preferences you want tied to this contact flow

Chapter 5 — Vercel and GitHub access

The buyer will need a Vercel account and a GitHub account to use this model blueprint workflow smoothly. These are important because they support deployment, updates, and source management.

- GitHub is used for repo-based source management
- Vercel is used for fast deployment and hosting workflows
- Accounts can be created before or after purchase, but setup cannot be completed without them

Notes — record whether you already have GitHub/Vercel accounts and what email they use

Expanded view of the complete system contents

1. The master blueprint

The master blueprint is the strategic brain of the offer. It explains how the system is structured, how the agents work together, and how a product can move from rough idea to launch materials with much less manual effort.

2. Deployable agent templates

The included templates shorten setup time by giving the buyer a starting point for each role in the system rather than forcing everything to be written from scratch.

3. Launch assets

These materials are meant to support actual go-to-market execution: offer positioning, email sequences, promotion concepts, and sales page structure.

4. Planning assets

The funnel blueprints and validation materials reduce guesswork by showing the intended customer path and the logic behind the offer sequence.

5. Actionability

This package is meant to be usable, not merely inspirational. That is why this workbook includes note sections throughout: the goal is to get the buyer organized enough that implementation can start without confusion.

What happens after you send your details

Once your response is received with the required information, setup can begin based on the described offer. At that point, your chosen model provider, domain, hosting identity, and account readiness determine the exact implementation path.

Plain-English summary: this package gets you informed, aligned, and ready. Once your reply arrives with the needed setup details, the actual product build path can begin.

Buyer checklist

- I have downloaded and reviewed the guide.
- I know which API provider(s) I want to use.
- I know which domain I want tied to the product.
- I have the name and email for the hosting account.
- I understand the project contact email is contactblocknewsmedia@gmail.com.
- I have or will create GitHub and Vercel accounts.
- I am ready to send my details so setup can begin.

Prepared for the Agentic Dominance Complete System offer.
